#### Introduction **Open-Domain Retrieval Pipeline** Stage 1 Stage 2 Where is the bowling Retriever Reader ➤ Arlington, Texas hall of fame located? Bowling Hall of Fame Question is located in Arlington, Retrieved Passages **Evidence Corpus** Stage 1: Given an information-seeking question, the first-stage retriever obtains a set of relevant passages from the evidence. **Stage 2**: These passages are attended to by a reader network to generate an answer for the question. **Research Question** How to Improve the First-Stage Passage Retrieval Accuracy?

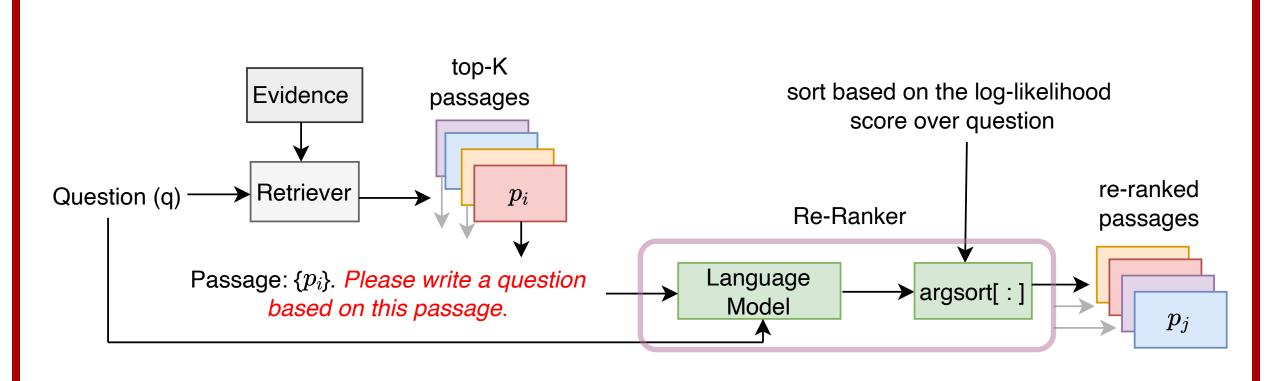

Significance

An improvement in retrieved passage rankings directly leads to more accurate

### **UPR:** Unsupervised Passage Re-ranking

We propose an unsupervised re-ranker to improve the ranking of a first-stage retriever.

- 1. Input: (i) Question (q) (ii) Evidence passages, such as segmented Wikipedia  $\,\mathcal{D} = \{oldsymbol{d}_1, \dots, oldsymbol{d}_M \}\,$
- Conditioned on the question, retrieve a large set of matching passages from evidence  $\mathcal{Z} = \{oldsymbol{z}_1, \dots, oldsymbol{z}_K\}$
- 3. Compute the log-likelihood of the question tokens conditioned on a passage with teacher-forcing using a large pre-trained language model.

$$\log p(\boldsymbol{q} \mid \boldsymbol{z}_i) = \frac{1}{|\boldsymbol{q}|} \sum_{t} \log p(q_t \mid \boldsymbol{q}_{< t}, \boldsymbol{z}_i; \Theta), \ \forall \boldsymbol{z}_i \in \mathcal{Z}$$

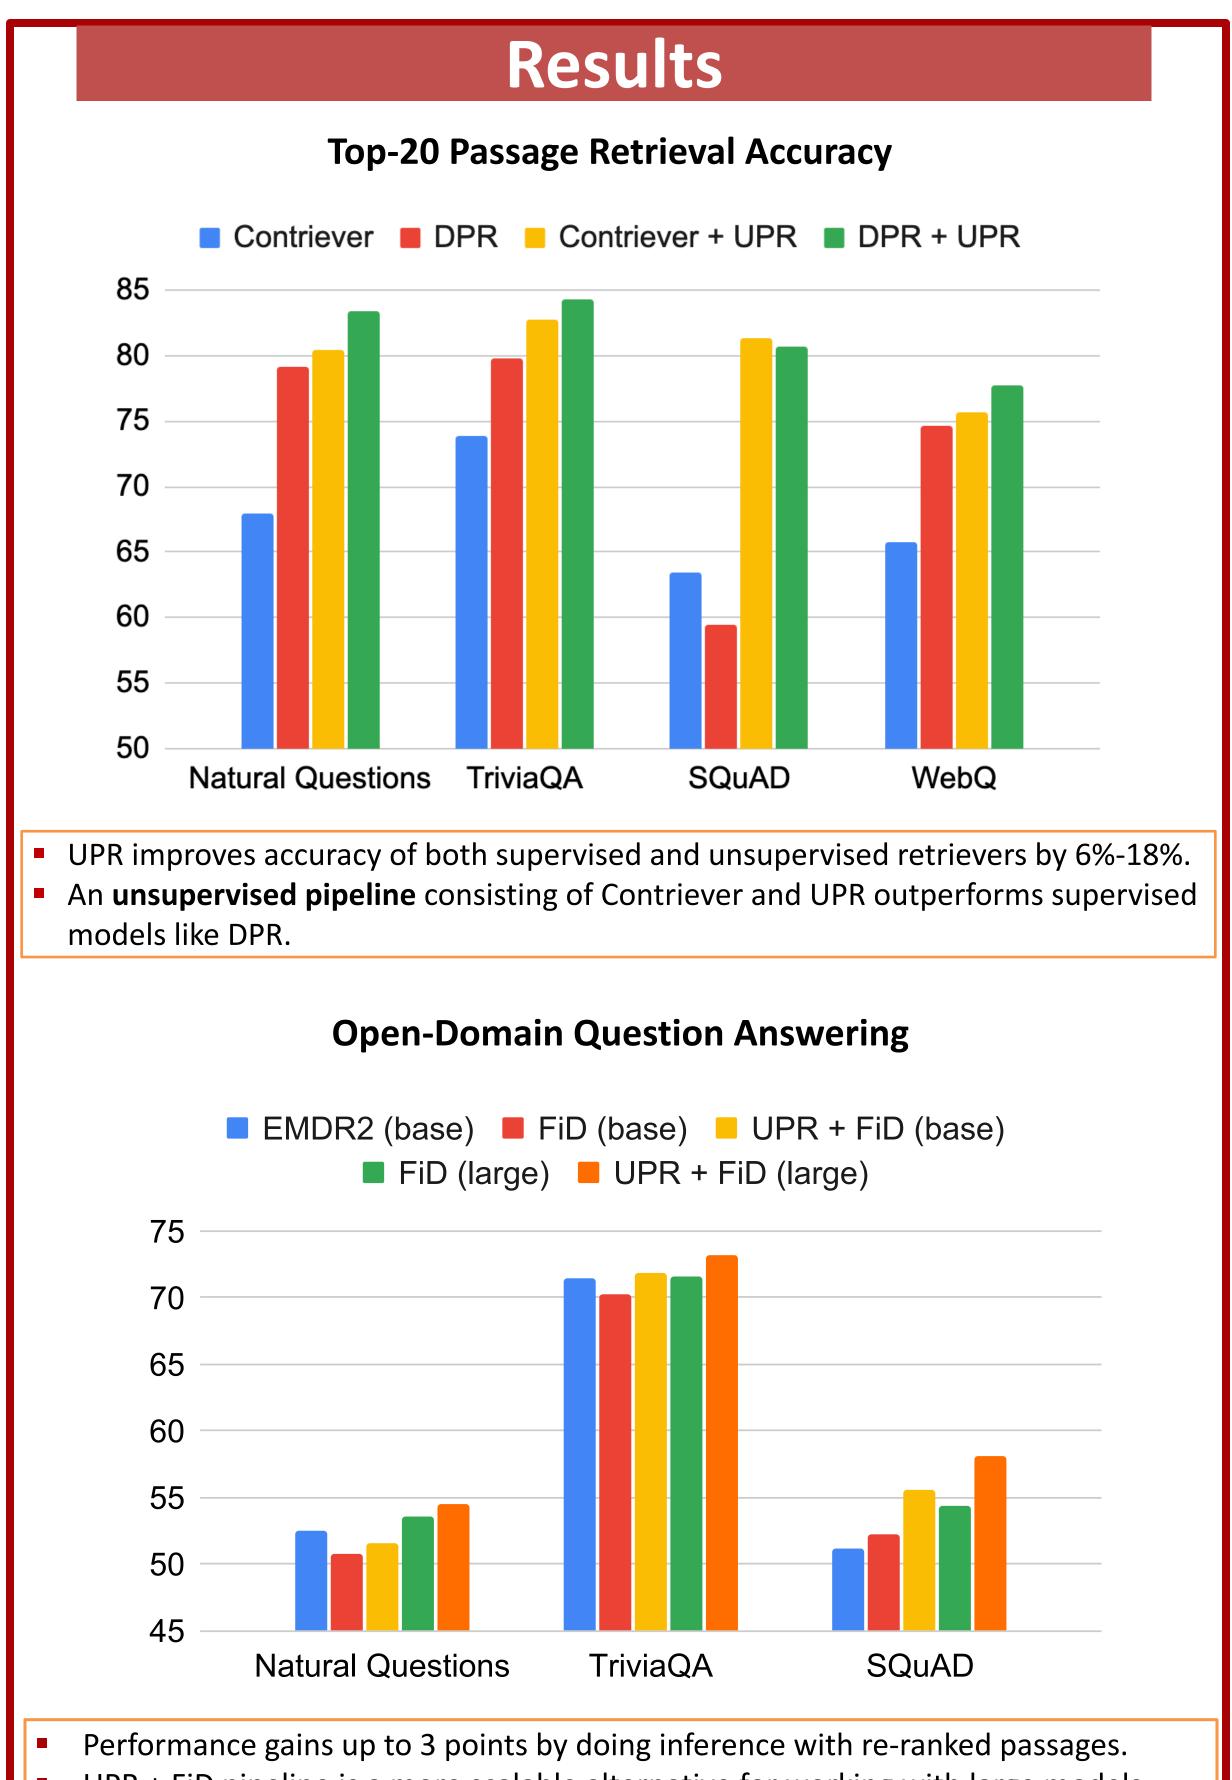

4. Sort the passage ordering based on the log-likelihood score  $p(\mathbf{q} \mid \mathbf{z}_i)$  and select the top 100 passages for final QA task.

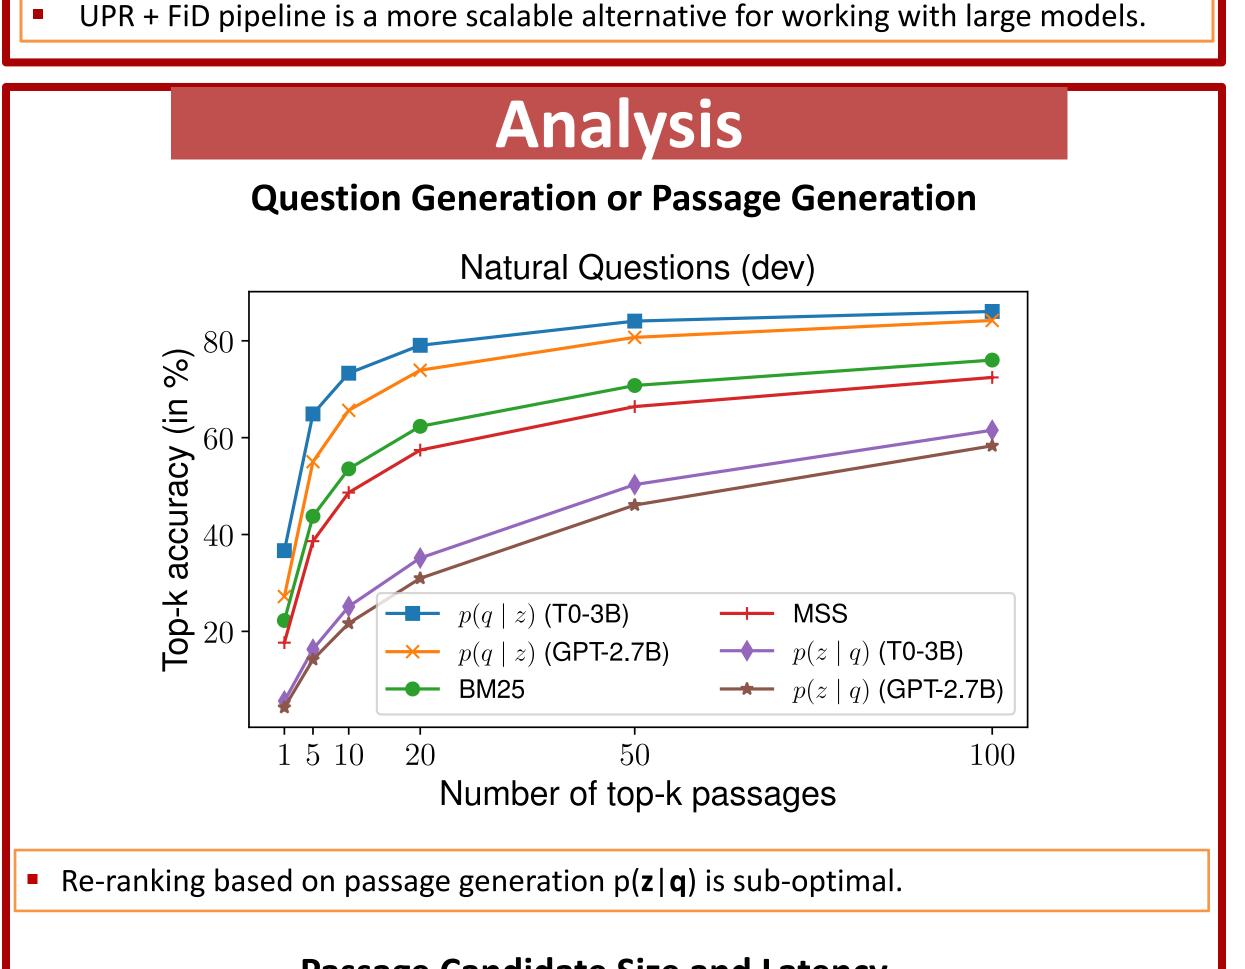

#### **Experimental Settings**

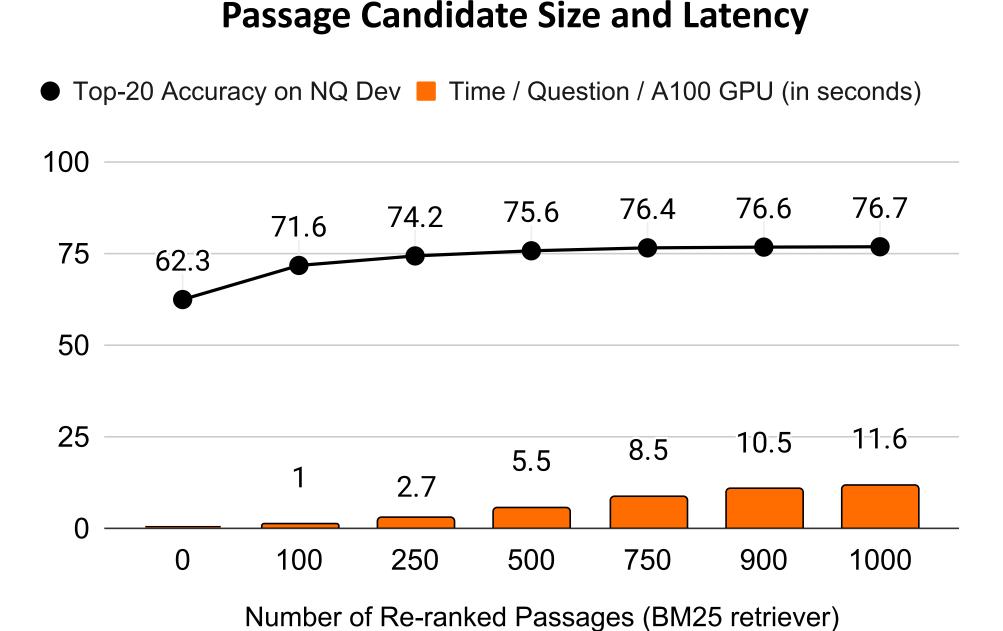

- We select the top-K = 1000 passages for re-ranking.
- We use the instruction-tuned T0 (3B) pre-trained language model in UPR.

## **UPR: Strengths**

- No training data is needed.
- Uses off-the-shelf pre-trained language models without finetuning.
- Can be applied to both sparse retrievers (such as BM25) and dense retrievers (such as DPR).
- Leverages rich cross-attention between question and passage tokens resulting in improved passage rankings.

- **Pros**: Retrieval accuracy improves with a larger pool of candidate passages.
- Cons: Latency increases linearly with the number of passages.
